

Forklift Attachment

Forklift Attachments Norwalk - Without forklift attachments, many jobs would be difficult, if not impossible. There are numerous forklift attachments that make jobs faster and safer to complete. Besides regular forklift training, operators also need to undergo proper training for every attachment they will be using. Many hydraulic and non-hydraulic forklift attachments are available. They offer numerous benefits by decreasing man-power, employee accidents, fuel consumption, damage to stock and time. Equipment Considerations Forklift attachments can replace existing attachments or may be added to a machine that doesn't already have one. Various considerations need to be taken prior to adding or replacing any forklift attachment. These considerations include the kind of forklift, the machine's capacity, the number of hydraulic functions required to power the attachment's and the type of carriage. Failure to properly consider these factors will increase the safety risk associated with operation of a forklift and its attachments and increase the risk for damage to the forklift, the attachment and surrounding area, including stock. There are further safety issues to take into consideration which can be discussed in more detail below. Forklift Rating and Re-Rating These machines are provided with lift capacity ratings from the manufacturer that need adjusting when changing or adding any forklift attachments. Online calculators are available from manufacturers of forklift attachment's to provide estimates on every attachments' lifting capacity. Accurate lifting capacities are only available from the forklift manufacturers. Before installing any kind of attachment, it is essential to contact the local authorized forklift dealer of the particular forklift brand to request that they rate the machine accordingly with the attachment being used. After the manufacturer of the forklift has re-rated the forklift, it should have a new factory authorized specification plate. This new specification plate will replace the original plate and should be installed showing the new rating for the forklift. Equipment Upgrades It is vital to note when working with forklift attachments the equipment's hydraulic function consists of a forklift valve that has a lever located near the operator which creates two areas for pressurized hydraulic passages for oil. While not all forklift attachments are hydraulic, hydraulic attachments often include more features than the forklift has valves. When this happens, the forklift needs to have one or more valves added. There are several methods of adding a valve. Forklift manufacturers make accessories for valve and hose routing. However, the parts and labor to install these can be so expensive as to make this option impractical. Other options include adding a cable reel and a hose in conjunction with a solenoid valve to divert oil from an existing location. However, the operators' view may be compromised due to the cable reels and hose installation. These parts also may be easily damaged by their location. There are kits available that use a solenoid valve and specialty hoses that allow for the reinforced braid to double as an electrical conduit. Since these hoses replace existing forklift hoses, they remain safe from external damage while maintaining clear vision for the operator. Safety Considerations Prior to fitting any type of forklift attachment, proper training must be obtained. An operator must be competent in the fitting, operating and removal of the attachment. There are 2 vital safety factors to think about before operating any type of forklift attachment. Firstly, it is important to note that any kind of forklift attachment will reduce the machine's nominal load rating. The nominal load rating is determined with forks and a stock fork carriage. It is important to note that the real load rating may be significantly lower. Secondly, the forklift's center of gravity will be affected when any forklift attachment is added. Obviously, the stability of the forklift is reduced. Since the attachment's weight is prominent in front of the fulcrum point on the forklift, the operator needs to drive the machine as though it is partially loaded even before it is carrying a load. It is essential that operators travel slowly and make gentle turns when using any kind of forklift attachment. Every attachment should be listed on the forklift capacity data plate. Certain safety checks need to be done before using any kind of attachment. The forklift attachment must be permitted on the forklift's data plate, locked properly, correctly attached, appropriate for the particular load and appropriate for the type of forklift being used. List

of Common Forklift Attachments A list of the most common attachments and their general uses are set out below. There are many more attachments available than are listed here but this will cover the most widely-used. Forklift attachments are designed to increase job efficiency for many applications. SIDESHIFTER: The operator can manipulate the forks laterally with a sideshifter. This allows for easier load placement without having to move the entire forklift. FORK POSITIONERS: Moves the forks together or apart in relation to one another to adjust for various load types. DIMENSIONING DEVICES: Dimensioning devices feature cargo dimensions useful for creating better efficiency in trucks, trailers and warehouses. This technology is often used alongside billing systems that monitor volume. ROTATOR: Assists in righting skids that have tilted, handling custom load requirements and quick unloading. Numerous attachments have a rotator feature. ROLL AND BARREL CLAMP: The roll and barrel clamp allows the forklift to grasp rounded loads including barrels. It is outfitted with different pressure settings to facilitate fragile options and often has a rotate function to simplify horizontal and vertical positioning. CARTON AND MULTIPURPOSE CLAMP: Allows for grasping a load with a more squared shape, often with pressure settings. Products like cartons, boxes and bales can be moved with this type of attachment. POLE ATTACHMENTS: Pole attachments are placed where the forks would normally be and are used for transporting carpet and rolled up linoleum. SLIP SHEETER OR PUSH-PULL: Slip sheeter or push-pull attachment lets the operator move slip sheets with a clamping option instead of pallets. It can pull the slip sheet onto thin and wide metal forks to facilitate pushing or loading. The attachment variations include "Save," where the slip sheet is removed to be used again or "Standard." DRUM HANDLER: The drum handler is specifically designed to transport drums. It might feature arms to hold the drum or be a spring-loaded model to grip the top lid. DRUM AND STORAGE BIN TIPPER: The drum and storage bin tipper is designed for easier transport of liquid items or loose materials into bigger containers. MAN BASKET: The lift platform known as a man basket is designed to transport workers vertically. It is outfitted with brackets and railings to anchor safety harnesses. TELESCOPIC FORKS: Allows operation in a warehouse using two pallet stacking where one shelf is placed directly behind another with no aisle between the two. SCALES: Scales allow forklift operators to weigh their pallets during transport. This increases efficiency by providing simultaneous data and not making the operator travel back and forth to scales. This attachment can be used for operators who bill by weight in legal-for-trade applications. SINGLE-DOUBLE FORKS: Allow movement of a single pallet or platform or two pallets side by side. With the correct attachment/s a single forklift can be used for multiple specialist materials handling tasks alongside normal lifting tasks, thus reducing the need for owning a specialist unit alongside a normal unit and the larger running and maintenance costs associated with multiple units. SNOW PLOW: Snow plows are used to remove snow and redistribute it; however, this attachment can be used with other loose kinds of material. SKIPS: Allows safe and speedy removal of waste to the appropriate skip or waste compactor. Skips are available in a roll-forward type and a bottom-emptying type. BOOMS AND JIBS: Booms and jibs allow forklifts extended reach. They are available to transport deep or highly stacked loads, suspended loads and more. These attachments can be low profile, precision lifting or reach over models to facilitate extended lengths.
